

Extension Manager Registration Baseline

This package adds a basic SQLite-backed registration model for the Extension Manager. It supports manual registration of development projects instead of scanning folders for DLLs.

Included files

- Extensions/Core/CodexExpensa.Navigation.Abstractions/Models/ExtensionProjectRegistration.cs
- Extensions/Host/CodexExpensa.ExtensionDevHost/Data/ExtensionRegistrationRecord.cs
- Extensions/Host/CodexExpensa.ExtensionDevHost/Data/ExtensionManagerDatabase.cs
- Extensions/Host/CodexExpensa.ExtensionDevHost/Data/ExtensionManagerSchema.sql
- Extensions/Host/CodexExpensa.ExtensionDevHost/Data/ExtensionManager.basic.db

Important note

This package is additive starter work, not a replacement for your current implementation. It does not overwrite MainForm.cs or other live host files because those real current files were not provided in this conversation.

Database table

- ProjectName (TEXT, primary key)
- RelativeBinPath (TEXT, nullable)
- AssemblyName (TEXT, required)
- IsEnabled (INTEGER, required, default 1)
- SortOrder (INTEGER, required, default 0)

Next integration step

Wire your actual host UI and loading pipeline to open this database, read enabled registrations, resolve assembly paths, and load assemblies by reflection.
