

CodexExpensa Extension Manager – Catch-Up

Current baseline

- Repo root: D:\Git\CodexExpensa\Extensions
- Projects: ExtensionDevHost, Feature.Websites, Navigation.Abstractions, Navigation.Hosting, Navigation.Hosting.Tests

Locked rules

- Zip root must be Extensions
- Manager DB: %AppData%\Expensa\Extensions\ExtensionMgr.db
- One DB per extension
- Runtime load from copied cache, not build output
- SqlQuery uses INSERT OR REPLACE maintenance
- SqlText must stay readable text

Command/menu system

- CommandRegistry owns menu creation
- MainForm stays thin
- Commands define defaults
- JSON owns menu metadata overrides
- Ordering uses MenuOrder and ItemOrder
- Separators are supported

Command metadata persistence

- JSON path: %AppData%\Expensa\Extensions\CommandMenuConfig.json
- Overrides persist CommandKey, MenuText, MenuOrder, ItemOrder
- Menu should redraw live when metadata changes

Current pain point

- CommandCatalogForm constructor drift between 2-arg and 3-arg versions
- OpenCommandCatalogCommand must pass CommandRegistry, CommandConfigPath, and RebuildMenu when using JSON editor version

Next likely work

- Stabilize current command catalog constructor/call-site
- Finish drag reorder + autosave + live redraw
- Keep JSON editor tab and open-folder support

Suggested commit message

Refactor ExtMgr menu system into registry-driven commands with JSON-backed menu config
