

Extension Dev Host Refactor Plan

Goal

Turn the main tree into the primary workspace. Tree selection should load sub-forms or document editors into the main content panel. Separate popup forms should mostly go away except for simple dialogs or folder-opening actions.

Phase 1 — Clean Up Main Tree Structure

New top-level tree layout

- Project
 - OpenAI API Key
 - AI Add-in Designer
 - New Project Space

Add-in Projects

- [Project Name]
 - Catch-Up Doc
 - Design Spec
 - Expensa Integration Spec
 - Project Folder
 - Docs Folder
 - [doc files...]
- Templates
 - Add-in Design Spec Template
 - Expensa Integration Spec Template

Tools

- Manage Extensions
- Command Catalog
- Query Catalog

Docs

- AI Add-in Design Workflow
- other remaining docs

Remove these from Add-in Projects:

Manage Extensions

AI Scaffold Files

Global Catch-Up Doc

General Coding Rules

Add-in Design Spec Template

Expensa Integration Spec Template

Remove the AI node entirely after moving its useful items.

Remove Project Space as a top-level node after moving New Project Space to Project.

Phase 2 — Project Node Changes

OpenAI API Key

Change from popup/dialog behavior to an embedded sub-form in the main content panel.

Expected behavior:

Project → OpenAI API Key

loads an API key management panel with:

Key name

masked key display

show/hide button

save/update button

test API button

Move AI Test here as a button/link:

Test OpenAI Connection

AI Add-in Designer

Move to:

Project → AI Add-in Designer

Clicking the tree node should load the AI designer into the main content panel, not open a separate form.

New Project Space

Move to:

Project → New Project Space

This can still be a workflow form/panel, but it should load in the main content area.

Phase 3 — Add-in Projects Node

Each registered project should look like this:

Add-in Projects

- WebsiteTagger
 - Catch-Up Doc
 - Design Spec
 - Expensa Integration Spec
 - Project Folder
 - Docs Folder
 - CatchUp.md
 - Addin_Design_Spec.md
 - Expensa_Integration_Design_Spec.md

Project documents

Clicking these loads the markdown editor:

Catch-Up Doc

Design Spec

Expensa Integration Spec

Expensa Integration Spec

This document should specifically describe:

how the add-in will be consumed by Expensa

navigation integration

commands

forms

database/query catalog impact

deployment/update behavior

Project Folder

Keep double-click only behavior:

double-click → open folder in File Explorer

single-click → show simple info panel

Docs Folder

Double-click opens folder.

Single-click expands/list docs.

Each document under Docs Folder should open in the text editor.

Phase 4 — Templates Node

Create a new top-level node:

Templates

Move these here:

Add-in Design Spec Template

Expensa Integration Spec Template

These should open in the markdown editor.

Phase 5 — Tools Node

Current tools should become embedded panels instead of separate popup forms.

Tools

- Manage Extensions
- Command Catalog
- Query Catalog

Clicking a tool node should load its UI into the main content panel.

Target behavior:

single-click tool node → loads tool sub-form into contentPanel

No separate window unless explicitly needed.

Phase 6 — Docs Node Cleanup

Remove:

Global Catch-Up Doc

General Coding Spec

Keep:

AI Add-in Design Workflow

other useful general docs

Templates move out to the new Templates node.

Phase 7 — Implementation Order

Step 1

Refactor tree-building only.

No behavior changes yet.

Step 2

Add a generic content-host method:

ShowEmbeddedForm(Form form)

This becomes the standard way to load sub-forms into contentPanel.

Step 3

Convert OpenAI API Key into an embedded panel/form.

Step 4

Convert AI Add-in Designer into embedded content.

Step 5

Convert Tools forms into embedded content.

Step 6

Clean up Add-in Projects node and add Docs Folder document listing.

Step 7

Add Templates node.

Step 8

Final cleanup:

remove obsolete AI Scaffold Files references
remove obsolete top-level AI node
remove obsolete Project Space node
remove old popup-only commands where no longer needed

Step 9

Update docs:

Catch-Up doc

General Coding Rules

Navigation design spec

Expensa integration design spec

Recommended first coding target

Start with the tree structure and embedded-form host method. That gives us the foundation without breaking every command at once.
