

CodexExpensa Extensions Solution Analysis (Corrected)

This document captures the actual baseline solution shape for the Extensions repository so future work stays aligned to the real project structure.

Confirmed source of truth

The reliable source in this conversation is the Visual Studio screenshot showing the solution that loaded successfully.

Confirmed loaded projects

- 1 CodexExpensa.ExtensionDevHost
- 2 CodexExpensa.Feature.Websites
- 3 CodexExpensa.Navigation.Abstractions
- 4 CodexExpensa.Navigation.Hosting
- 5 CodexExpensa.Navigation.Hosting.Tests

Actual solution interpretation

Host

- CodexExpensa.ExtensionDevHost

Module

- CodexExpensa.Feature.Websites

Core navigation contracts and plumbing

- CodexExpensa.Navigation.Abstractions
- CodexExpensa.Navigation.Hosting

Tests

- CodexExpensa.Navigation.Hosting.Tests

Important naming reality

The current codebase uses the CodexExpensa.Navigation.* naming family for the shared extension infrastructure. Future work should not invent replacement project names unless you intentionally choose to refactor the solution.

Confirmed interface direction

- ITreeExtensionHost visible in namespace CodexExpensa.Extensions.Core.Abstractions
- ITreeNodeExtension visible in namespace CodexExpensa.Extensions.Core.Abstractions
- Visible model types include TreeNodeContext, TreeNodeDefinition, and TreeNodeKinds in CodexExpensa.Extensions.Core.Models

Important inconsistency to remember

The conversation revealed a namespace split between CodexExpensa.Navigation.* and CodexExpensa.Extensions.Core.*. That means future changes must verify the actual file in the repo before changing namespaces or type names.

Safe baseline for future work

- 1 Repository root is D:\Git\CodexExpensa\Extensions
- 2 Treat the five loaded projects as the actual working baseline
- 3 Do not invent synthetic replacement solutions when the real one already exists
- 4 Before changing an interface or model type, inspect the real file first
- 5 Future zip deliverables for this repo should be rooted from the Extensions repo root
- 6 Documentation deliverables should include both .md and .pdf

Summary

The real baseline solution for the Extensions repo is the manually built solution showing these five projects: CodexExpensa.ExtensionDevHost, CodexExpensa.Feature.Websites, CodexExpensa.Navigation.Abstractions, CodexExpensa.Navigation.Hosting, and CodexExpensa.Navigation.Hosting.Tests.
